

HyProtect® Medical Technology for your Pet

HyProtect® Treated Implants are Designed to Support Healing

HyProtect is an ultrathin plasma coating containing pure silver which protects the surfaces of medical implants against bacterial colonization.

The pure elemental silver forms an antimicrobial surface. This helps to reduce the risk of infections at the site of surgery. Studies have shown an infection rate for HyProtect coated implants of less than 0.5%.

Actual cross section of HyProtect coating

- Pure elemental silver prevents bacterial biofilm formation
- Plasma polymer coating is highly biocompatible and not toxic to pet cells
- Together they promote an improved healing environment and combat antibiotic-resistant germs
